Amsterdam, April 2014 Commissioned by Randstad

Randstad specializes in solutions in the field of flexible work and human resources services. Our services range from regular temporary staffing and permanent placement to inhouse, professionals, search & selection, and HR Solutions. Randstad is one of the leading HR services providers in the world with top three positions in Argentina, Belgium & Luxembourg, Canada, Chile, France, Germany, Greece, India, Mexico, the Netherlands, Poland, Portugal, Spain, Switzerland, the UK and the United States, as well as major positions in Australia and Japan. In 2013, Randstad generated revenue of € 16.6 billion and had approximately 28,000 corporate employees and around 4,600 branches and Inhouse locations in 39 countries. On average, Randstad employed 567,700 candidates per day and placed over 85,000 candidates in permanent positions. Randstad was founded in 1960 and is headquartered in Diemen, the Netherlands. Randstad are also traded. For more information see www.randstad.com

The University of Sheffield is a member of the Russell Group of leading UK research universities and is rated 71st in the world in the 2013 QS World University Rankings, 13th in the UK in the 2013-14 Times Higher Education World University Rankings and is ranked in the top ten UK research-intensive universities. Sheffield University Management School, meanwhile, is one of only 59 business schools across the world to have achieved accreditation from all three business school associations: AACSB, AMBA and EQUIS. This triple-crown accreditation places it among the top one per cent of business schools in the world. With 1,300 undergraduate students and 1,000 postgraduate students, its mission is to develop knowledgeable and employable students, promote socially-responsible work practices and have a positive impact on organisations and society throughout the world.

Regioplan Policy Research Ltd, founded in 1986, is an independent policy research organisation fully geared towards policy-oriented research questions. Regioplans' expertise covers the socio-economic research fields, with core capabilities in providing insight in policy implications, evaluations of laws and policy instruments, performing country comparisons and determining best practises, statistical data analysis and assessments of data quality, labour market and sector studies, studies on vulnerable groups, studies on determining social and economic effects.

Regioplan is based in Amsterdam and employs approximately 50 researchers with expertise in a wide range of professional areas. It is not aligned to any public or private organisation or institution and is therefore well suited for third-party research on delicate policy issues.

SEO Economic Research carries out independent applied economic research on behalf of the government and the private sector. The research of SEO contributes importantly to the decisionmaking processes of its clients. SEO Economic Research is connected with the Universiteit van Amsterdam, which provides the organization with invaluable insight into the newest scientific methods. Operating on a not-for-profit basis, SEO continually invests in the intellectual capital of its staff by encouraging active career planning, publication of scientific work, and participation in scientific networks and in international conferences.

preface

Randstad is pleased to present the second edition of Flexibility@work: yearly report on flexible labor and employment. The Flexibility@work report provides a comprehensive overview of international employment trends in the flexible labor market. In Flexibility@ work we present a study every year on a topical development in the world of work and the 2014 edition will focus on the causes and prevention of undeclared work.

It is generally acknowledged that the undeclared economy lowers the quality of work and working conditions, undermines the business environment through unfair competition, and puts at risk the financial sustainability of social protection systems. Clearly, therefore, undeclared activities should not merely be discouraged, but should rather be transformed into regular work.

The study on undeclared work-conducted by Sheffield University and Regioplan- shows that in advanced economies the size of the undeclared economy varies widely – from less than 10% in countries such as the US, the UK, Japan and the Netherlands to more than 25% in parts of southern and eastern Europe. The study also reveals that countries with a smaller undeclared economy are those in which it is easier for companies to resort to temporary employment opportunities to meet labor demands and in which, at the same time, there is greater intervention (in the form of labor market policies that protect and support vulnerable groups of workers). Apparently, by creating the right environment, these relatively successful economies reduce the supply and demand of undeclared work by providing both workers and employers with better alternatives.

There is clearly a need for labor market policy to be approached much more actively, with unjustified restrictions on temporary work being lifted and relevant interventions stepped up. Governments, therefore, should be encouraged to create a mature system of social protection that not only supports workers who are ill or temporarily out of work, but also encourages an accessible, well-regulated market for temporary employment and temporary employment agencies.

In order for businesses, and indeed economies, to remain innovative and competitive in today's environment, flexibility – and therefore flexible labor – will be imperative. In my view, the whole debate about whether or not we want to allow flexible labor and temporary work is misplaced. Rather, the discussion should center on how it can best be regulated to create a win-win situation for both businesses and workers.

With our mission of 'shaping the world of work', Randstad understands the importance of having a thorough knowledge of all the current and future labor markets in which we provide our HR services. A flexible workforce has proven to increase productivity and improve competitiveness. Complementary to our existing knowledge of local markets, this annual publication is therefore a welcome addition to Randstad's knowledge base.

Jacques van den Broek CEO Randstad Holding NV

abstract

It is widely recognized that the undeclared economy is prevalent in many global regions. In fact, out of a global working population of some 3 billion, almost two-thirds (some 1.8 billion) work in the undeclared economy. It is also generally acknowledged that the undeclared economy lowers the quality of work and working conditions, undermines the business environment through unfair competition, and puts at risk the financial sustainability of social protection systems. Clearly, therefore, undeclared activities should not merely be discouraged, but should rather be transformed into regular work.

As to what causes undeclared work, there are two perspectives. On the one hand, the liberal, open-market perspective argues that the undeclared economy is a direct result of high taxes, state corruption and burdensome regulations and controls. On the other hand, there is the 'structuralist' perspective, which argues that undeclared work is the by-product of inefficient regulation, combined with a lack of labor market intervention and social protection.

This study - conducted by the University of Sheffield and Regioplan Policy Research - reveals that countries with a smaller undeclared economy are those in which it is easier for companies to resort to temporary employment opportunities to meet labor demands and in which, at the same time, there is greater intervention (in the form of labor market policies that protect and support vulnerable groups of workers). By creating the right environment these relatively successful economies reduce the supply and demand of undeclared work by providing both workers and employers with better alternatives.

introduction

The attention for the unobserved part of the western economies emerged around the turn of the millennium (Pedersen 1998, Mateman and Renooy 2001, OECD 2002). Eventually, a popular and recurrent belief was that the undeclared economy was disappearing and becoming a minor residue, existing only in a few marginal enclaves of the modern economy¹. This modernisation thesis, however, has been increasingly refuted. It is now widely recognized that the undeclared economy is widespread and growing relative to the declared economy in many global regions. Indeed, a recent OECD report finds that out of a global working population of some 3 billion, around two-thirds (1.8 billion) work in the undeclared economy². Such work, therefore, is far from being a small residual realm. It is a prominent feature of the contemporary global economy.

Therefore, recognition grew that the undeclared economy lowers the quality of work available, puts at risk the financial sustainability of social protection systems and undermines the business environment through unfair competition (European Commission, 2003, 2007; OECD, 2012; Williams and Renooy, 2013). The result is that governments have begun to pay greater attention to not only understanding the prevalence of, and reasons for, undeclared employment (Renooy et al, 2004; TNS Infratest et al, 2007) but also what needs to be done to bring such work out of the shadows (Dekker et al, 2010; Williams and Renooy, 2013).

In January 2014, the European Parliament adopted a resolution to improve working conditions in Europe³. In the resolution the Parliament points out the adverse effects of undeclared work (UDW) on the quality of working conditions. Therefore, it calls on policy makers and the social partners to step up the fight against undeclared work. In the same month, the European Commission published its Employment and Social Development in Europe 2013. In this working document on the Union's economy, undeclared work is one of the major topics. The document concludes that undeclared activities should not only be discouraged, but should rather be transformed into regular work.

How, therefore, can the undeclared economy best be confronted? What policies are the most successful in bringing back the magnitude of undeclared work and how can we prevent undeclared activities to grow in our western societies? To analyze this, after a description of the phenomenon in section 2, section 3 will outline the rationales for tackling the undeclared economy followed by section 4, in which an estimate of the size of the undeclared economy is given and how its magnitude is changing over time in the 28 European Union member states (EU-28) and five high-income OECD countries (Australia, Canada, Japan, New Zealand and the USA)⁴. Section 5 seeks to understand what causes the undeclared economy to be greater in some countries than others. We discuss the possible drivers of the development of undeclared activities. To do this, we commence by evaluating two competing perspectives (Williams, 2013a, b; Williams and Lansky, 2013), namely:

- a liberal, open market, perspective which argues that the undeclared economy is a direct result of high taxes, state corruption and burdensome regulations and controls. In this view economies should pursue tax reductions, de-regulation and minimal state intervention to prevent the undeclared economy from growing (e.g., Becker, 2004; De Soto, 1989, 2001; London and Hart, 2004; Small Business Council, 2004); and
- a structuralist perspective which argues that the undeclared economy is a by-product of the inefficient regulation of employment and lack of labour market intervention and social protection, and that one should therefore pursue state interventions in the labour market and social protection in order to tackle the undeclared economy (Davis, 2006; Gallin, 2001; Meagher, 2010; Slavnic, 2010).

We first explore the relationship between cross-national variations in tax rates and the size of the undeclared economy. Subsequently we focus on the possible impact of efficient labour markets, higher levels of social protection expenditure and greater levels of intervention in the labour market to help vulnerable groups on the existence and size of undeclared economies. Finally, in section 6, attention turns to how the undeclared economy develops in countries where it is easier for firms to employ temporary workers and to use temporary work agencies (TWAs). The findings, as presented in section 7, provide some salient lessons for governments.

^{3. (}P7_TA-PROV(2014)0012).

^{4.} The choice for these countries is based on the fact that Randstad is operating in these countries and that comprehensive data are available on these countries.

undeclared work; what are we talking about?

At the outset, a definition of undeclared employment is required, or what has been variously called the 'atypical', 'black', 'cash-in-hand', 'hidden', 'informal', 'irregular', 'non-visible', 'shadow', 'underground' or 'unregulated' economy/sector/employment/ work (see Williams, 2004). Despite the array of terms used there is a broad consensus on what is included and excluded. This consensus is reflected by defining undeclared work as 'any paid activities that are lawful as regards their nature but not declared to the public authorities, taking into account the differences in the regulatory system of Member States' (European Commission, 2007). This covers diverse activities from undeclared domestic services to clandestine activities conducted by illegal residents, but excludes the realm of criminal activity where illicit goods and services are exchanged. A multitude of empirical research has revealed the diverse forms of undeclared work that fit into this broad definition.

Firstly, it has been recognized that not all undeclared work is conducted on a waged employment basis. Much undeclared work is also conducted on an own-account basis as self-employment. It has been recognized that there are diverse forms of undeclared self-employment. Many engaged in undeclared self-employment display entrepreneurial attributes and traits and there has emerged an acknowledgment that the undeclared realm represents a 'hidden enterprise culture' and that many businesses start up while operating wholly or partially off the books.

Secondly, an array of types of undeclared waged employment has been identified. It has been shown that besides undeclared waged work which is low paid, exploitative and carried out by marginalised groups, there is also some waged employment that is relatively well-paid and conducted under less exploitative conditions by people already in well-paid formal jobs. There is also waged employment which is not wholly but only partially undeclared, namely 'under-declared' formal employment, where an officially registered employee is paid by their formal employer two wages, an official declared wage and a supplementary unofficial undeclared wage, sometimes known as an 'envelope wage'.

Thirdly, there has also been a recognition in the past few years that not all undeclared work is conducted under relations akin to employment and for profit-motivated rationales. Instead, it has been identified that much undeclared own-account work involves one-to-one paid favours whereby undeclared payments are made for work conducted by and for kin, friends, neighbours and acquaintances for primarily social and redistributive reasons.

rationales for tackling the undeclared economy

Undeclared work causes concern to western economies. From a macro-economic point of view, it obstructs tax revenues and undermines the financing of and trust in the system of social security (EC 2014). For an adequate policy response it is furthermore necessary to highlight its consequences for various groups in society, namely legitimate businesses, individuals and businesses working in the undeclared economy, customers and governments.

For legitimate businesses, the rationales for seeking the elimination of the undeclared economy are that it causes:

- an unfair competitive advantage for illegitimate businesses over legitimate enterprises (Grabiner, 2000);
- de-regulatory cultures enticing law-abiding firms into a local 'race to the bottom' away from regulatory compliance (Williams and Windebank, 1998); and
- circumstances of 'hyper-casualisation' as more legitimate businesses become forced to turn to the undeclared economy to compete (Evans et al, 2006).

Individuals working in the undeclared economy, meanwhile, want to see it eradicated because they:

- lack access to health and safety standards in the workplace (ILO, 2002);
- do not have employment rights such as annual and other leave, sickness pay, severance pay and training (Evans et al, 2006);
- have low job security (Williams, 2001);
- are unable to get an employer's reference (ILO, 2002);
- lack access to a range of other legal rights such as the minimum wage, tax credits and the working hours directive (Leonard, 1998);
- are unable to gain access to credit (Kempson, 1996);
- cannot build up rights to the state pension and other contributory benefits, and access occupational pension schemes (Gallin, 2001);
- lack bargaining rights (ILO, 2002);
- lose employability due to their lack of evidence of engagement in employment; and
- suffer a constant fear of detection and risk of prosecution (Grabiner, 2000).

For businesses operating in the undeclared economy, the key rationales are that they are in a disadvantaged position operating outside, or at the margins, of the declared economy, resulting in their:

- pressurisation into exploitative relationships with the formal sphere;
- lack of legal protection relative to formal businesses (Castells and Portes, 1989); and,
- inability to develop and grow due to structural constraints with regard to gaining access to capital and securing the support available to formal businesses (ILO, 2002).

For customers using the undeclared economy, furthermore, the rationales are that they find themselves without (Renooy, 1990):

- legal recourse if a poor job is done;
- insurance cover;
- guarantees in relation to the work conducted; and
- certainty that health and safety regulations have been followed.

Finally, for governments, the rationales are that the undeclared economy:

- causes a loss of revenue for the state in terms of non-payment of income tax, national insurance and VAT;
- has knock-on effects on attempts to create social cohesion at a societal level by reducing the money available to governments to pursue social integration and mobility (Williams and Windebank, 1998);
- results in weakened trade union and collective bargaining power (Gallin, 2001);
- leads to a loss of regulatory control over the quality of jobs and services provided in the economy (Gallin, 2001); and
- if a significant segment of the population is routinely engaged in such activity, it may well encourage a more casual attitude towards the law more widely (Renooy et al, 2004).

what is the size of the undeclared economy?

Measurement methods

Measuring the size of the undeclared economy is difficult because it is by definition hidden from view. Broadly speaking, the methods that can be used to measure the extent of the undeclared economy can be grouped into direct methods, indirect methods and (other) modelling. Most of these methods are designed to express the size of the undeclared work in percentages of GDP.

Direct methods are mostly based on large-scale surveys. They can be conducted by telephone, postal or web questionnaires, or through large-scale face to face interviewing. This method was widely applied by the Danish Rockwool Research Foundation (Pedersen 2003). In 2007, a Europe-wide direct survey was conducted, which was repeated in 2013 (Special Eurobarometers 284 and 402). The survey covers all members states of the European Union. Outside Europe no comparable surveys were conducted.

More commonly used to estimate the size of the undeclared economy are indirect methods. Indirect measurement methods are often adopted which measure its size using proxy indicators and/or statistical traces of undeclared work found in data collected for other purposes. These indirect methods range from those using monetary indicators as proxies, such as the currency demand method which takes the use of cash as an indicator of informality, to methods using non-monetary indicators, such as discrepancies in the labour supply figures across different surveys, to methods using discrepancies between income and expenditure either at the aggregate or household level, and to measurement methods using multiple indirect indicators (GHK and Fondazione Brodolini, 2009).

A specific type of indirect measurement is the one based on economic modelling. These techniques were first used by Frey and Weck-Hanneman (1984) and optimized by the Austrian economist Friedrich Schneider. Schneider developed the dynamic multiple-indicators multiple-causes (DYMIMIC) model(s). This approach is based on the idea that undeclared work is an unobserved (latent) variable. On the one hand, it is influenced by certain (quantitatively measurable) causes, such as tax burden and regulation intensity. On the other hand, it influences other variables, seen as indicators reflecting undeclared activities, such as currency demand and labour participation rates (for a detailed description of how this method calculates the size of the undeclared economy, see Schneider, 2005).

The indirect methods mostly produce higher estimates of the size of the undeclared economy than direct methods, leading proponents of indirect methods to suggest that participants conceal their undeclared work from researchers. Although there is no way of knowing whether direct surveys produce under-estimates or indirect methods produce inflated estimates of its size, the consensus across the practitioner and academic communities is to use indirect measurement methods to measure the size of the undeclared economy and survey methods to evaluate its nature (European Commission, 2007b; OECD, 2012;).

Following this emergent consensus, this paper estimates the size of the undeclared economy using the widely used indirect measurement method, namely the DYMIMIC method. Although the method is far from being free from criticism (Breusch, 2005) the advantage is that this method is commonly used by agencies such as the World Bank to estimate the variable size of the undeclared economy globally (Schneider et al., 2010) and is the only method providing data on all of the EU-28 and five high-income OECD countries (Australia, Canada, Japan, New Zealand and USA) considered in this paper. Moreover, we found a positive and significant correlation between Schneider's findings and the results on a set of questions in the 2013 Eurobarometer indicating the incidence of undeclared work by country.

Cross-national variations in the size of the undeclared economy

Figure 1 displays the size of the undeclared economy in 33 western economies, according to Schneider (2013).

The figure clearly shows significant cross-national variations in magnitude of the undeclared economy, ranging from 6.6 % in the USA to 31.2 per cent in Bulgaria. In some countries, therefore, the undeclared economy is a larger problem than in others. Generally, the size of the undeclared economy is more extensive in East-Central and Southern European countries. It is usually smaller, meanwhile, in West European, Nordic and other higher-income OECD countries.

Figure 1 size of the undeclared economy as % of GDP, 2013: by country

Source: derived from Schneider (2013: Table 1)

Changing size of the undeclared economy

The undeclared economy is not a static phenomenon. Two competing views exist regarding what has happened to the size of the undeclared economy during the current period of economic crisis. One view is that it has grown relative to the declared economy since firms and households seek to save on costs to support falling profit and income by substituting declared work with undeclared work, and unemployed workers are more willing to engage in undeclared work as a coping strategy. An alternative view is that the undeclared economy has declined because: there is a lower demand for undeclared labour due to less money being available; traditional sectors where undeclared work is concentrated (e.g., construction, hotels and restaurants) have been hit harder during this period of economic crisis; and undeclared work is substituted by 'flexible' and cheaper declared labour.

From the results of the recent special Eurobarometer (EC 2014), it appears that overall the extent of undeclared work is rather stable. There are, however, distinct country developments that are not necessarily related to the economic crisis. Some European countries with high levels of undeclared work experienced a strong reduction, while others saw a small increase. The incidence of envelope wages seems to have reduced, in particular in Central and Eastern Europe.

The results of the analysis Schneider (2012) conducted reveal that besides a slight rise between 2008 and 2009, undeclared work has continued to decline in size relative to the declared economy across all countries between 2003 and 2012. The current economic crisis, therefore, has not reversed the previous trend of an on-going incremental decline in the size of the undeclared economy as a proportion of GDP. Neither the findings of Schneider nor those of the special Eurobarometer are indicating a growth of undeclared activities. However, both approaches do show considerable cross-national variations in the size of the undeclared economy. In the next sections we turn to the question how to explain these variations.

Figure 2 undeclared economy as % of GDP, 2003-2013

As we have shown in the figures 1 and 2, there are considerable variations in the size of the undeclared economy in the countries under study. In the sections below, we will explore what explanations we can find for these differences. Is it, for instance, the case that the undeclared economy is larger in economies with higher taxes, public sector corruption and more regulated regimes, as intimated by iberals? Or alternatively, is undeclared employment larger in economies where there is an under-regulation of employment, lack of labour market intervention and reductions in state welfare provision, as the stucturalist commentators posit?

To answer these questions, we here analyze whether there is a statistically significant relationship between the cross-national variations in the size of the undeclared economy and the cross-national variations in work and welfare regimes. To do this, we first analyze the relationship between the cross-national variations in the size of the undeclared economy and cross-national variations in tax rates and corruption, secondly the relationship between the undeclared economy and spending on social protection and labour market interventions. Thirdly and finally, we explore the relationship between the undeclared economy and employment regulation with regard to temporary employment and temporary work agencies (TWAs). This is an interesting relationship, as temporary employment is not seldom seen as an employment relation that can bring about undeclared work (see Renooy 2013, EP 2014).

The role of tax rates

From a liberal, free market perspective, high tax rates drive people into the undeclared economy. To evaluate this, the correlation between cross-national variations in tax rates and the size of the undeclared economy across countries can be examined. Figure 3 compares the total tax revenue as a percentage of GDP across the 28 EU member states and five OECD countries (OECD, 2012a). Given the non-parametric nature of the data, Spearman's rank correlation coefficient is here used to evaluate whether there is a significant correlation. This identifies that a significant correlation does not exist (rs=-0,164). An increasing tax burden, in other words, does not result in higher percentages of undeclared work.

Figure 3 relationship between the size of the undeclared economy and total tax revenue as a % of GDP, 2011

Given how this contests a core assumption of the liberal perspective, this relationship is here further analyzed using another measure of tax rates, namely taxes on personal income as a % of GDP (OECD, 2012b). As Figure 4 reveals, it is again the case that as the level of tax on personal incomes increases, the size of the undeclared economy diminishes. However, there is no statistically significant relationship between the cross-national variations in the level of tax on personal incomes and cross-national variations in the level of tax on personal incomes and cross-national variations in the prevalence of the undeclared economy (rs= -.228). Again, therefore, no evidence is found to support the liberal thesis.

Figure 4 relationship between size of the undeclared economy and the level of taxes on personal income as a % of GDP, 2011

This is again the case when the relationship between cross-national variations in the taxes on income and profits as a proportion of GDP is compared with crossnational variations in the size of the undeclared economy. As figure 5 reveals, it is again the case that as the level of taxes on income and profits increases, the size of the undeclared economy decreases, although this is again not statistically significant (rs= -.422). There is thus no evidence that higher tax rates are associated with a greater prevalence of the undeclared economy across these 33 countries. Instead, if anything, quite the opposite is the case; as tax levels as a proportion of GDP increase, the prevalence of the undeclared economy reduces.

Figure 5 relationship between the size of the undeclared economy and the level of taxes on income and profits as a % of GDP, 2011

In Employment and Social Developments 2013, Vanderseypen and Tchipeva explore the relation between taxation on labour and the extent of undeclared work, as measured in the special Eurobarometer 2013. As indicators for the tax burden on labour, they make use of the implicit tax rate on labour, the share of labour wages in total taxes and the tax wedge on labour. They find no correlation whatsoever between these tax indicators and the incidence of either private supply of undeclared work or envelope wages.

..and corruption?

To examine the liberal open market hypothesis that public sector corruption leads to undeclared employment being more prevalent, we use the Transparency International's 2013 Corruption Perceptions Index (CPI). This CPI explores perceptions of public sector corruption and is a composite index drawing on 14 expert opinion surveys (Transparency International 2013). This index scores countries on a scale from zero to 100, with zero indicating high levels and 100 low levels of perceived public sector corruption. A strong correlation is found between cross-national variations in the level of public sector corruption and cross-national variations in the prevalence of the undeclared economy (rs= -.717**). The higher the perceived level of public sector corruption is, the greater is the prevalence of the undeclared economy. This, therefore, supports the liberal assertion that undeclared employment is an exit strategy pursued by those confronted by bribes and corruption when seeking to enter or remain in the declared economy.

Figure 6 relationship between perceptions of public sector corruption and the size of the undeclared economy as a % of GDP, 2013

Evaluating the liberal explanation, therefore, there is no evidence that higher tax levels are correlated with undeclared work being more prevalent. Indeed, if anything, quite the opposite seems the case. However, greater levels of public sector corruption are correlated with undeclared work being more prevalent.

The next possible driver behind the incidence of undeclared work we turn to is the level of state interferences in the market. Do greater levels of state interference in the free market, as liberal thesis asserts, lead to a greater prevalence of the undeclared economy? Or is it the case, as the structuralist perspective claims, that the prevalence of the undeclared economy is larger in countries where there is a lack of state intervention in work and welfare regimes in the form of expenditure on social protection and labour market interventions?

The role of spending on social protection and labour market interventions Labour markets which function efficiently and correct disequilibria have smaller undeclared economies. To see this, the relationship between cross-national variations in the efficiency of labour markets and the size of undeclared economies can be analyzed using the 'Labour Market Efficiency Index' developed by the Boston Consulting Group and the International Confederation of Private Employment Agencies, Ciett (Boston Consulting Group and Ciett, 2013). The index rankings are based on 6 criteria calculated for each country: overall employment rate (% working age population 15-64), employment rate 15-24 (% population 15-24), employment rate 55-64 (% population 55-64), annual hours worked (per person employed), labour participation rate (% of working age population) and unemployment rate (% of labour force). As the data plotted by the Labour Market Efficiency Index demonstrates in Figure 7, there is a strong correlation between labour market efficiency and the size of the undeclared economy (rs=-0.600**); countries which have more efficient labour markets are the ones where undeclared work is lower. There is thus strong evidence to show that labour market efficiency influences the size of the undeclared economy.

Figure 7 relationship between labour market efficiency and the size of the undeclared economy, 2011

Can we, therefore, assume that inefficient labour markets that have larger undeclared economies are the result of too much or too little state intervention? To begin to examine this, we examine the relationship between more state expenditure on labour market interventions aimed at correcting disequilibria and the size of the undeclared economy by analyzing cross-national variations in the proportion of GDP spent by governments on interventions in the labour market (Eurostat, 2013d). Here, labour market interventions cover all public interventions in the labour market aimed at reaching its efficient functioning and correcting disequilibria. They can be distinguished from other general employment policy interventions in that they explicitly target groups with difficulties in the labour market, namely: the unemployed; those employed but at risk of involuntary job loss; and people who are currently inactive in the labour market but would like to work. As figure 8 displays, in economies which pursue higher levels of expenditure as a proportion of GDP on labour market interventions, the prevalence of undeclared employment is smaller. This, moreover, is statistically significant (rs=-0.555**).

Figure 8 relationship between state labour market expenditure and size of undeclared economy 2010

These labour market interventions are classified into three main types, which are further broken down into the following nine detailed categories according to the type of action:

Labour Market Policy (LMP) services

1. Labour market services;

LMP measures

- 2. Training;
- 3. Job rotation and job sharing;
- 4. Employment incentives;
- 5. Supported employment and rehabilitation;
- 6. Direct job creation;

- Out-of-work income maintenance and support;
- 9. Early retirement.

The strong positive correlation between increased public expenditure on labour market policy interventions and a decrease in the size of the undeclared economy occurs whichever form of labour market expenditure is considered. There is a strong correlation between a reduction in the size of the undeclared economy and increased expenditure on labour market policy interventions no matter whether category 1 (labour market policy services) interventions are considered (rs=-0.427**), category 2-7 (labour market policy measures) interventions are analyzed (rs=-0.546**) or category 8 and 9 (labour market policy support) interventions are considered (rs=-0.696**).

To further analyze this relationship between state interventions and the size of the undeclared economy, the relationship between cross-national variations in the level of state intervention in social protection and cross-national variations in the prevalence of the undeclared economy can be examined. To achieve this, the level of total social expenditure per head of the population is analyzed at current prices and taking into account personal purchasing power standards (PPPs) (OECD 2013a).

As figure 9 reveals, the larger the level of social expenditure per head of the population, the less prevalent is the undeclared economy (rs=-0.524**). This negates the liberal explanation that reductions in social expenditure will reduce the undeclared economy and supports the explanation that greater state intervention in welfare arrangements reduces the size of the undeclared economy, since it provides people with an alternative means of survival and decreases their need to turn to the undeclared economy as a survival practice.

Figure 9 relationship between social protection benefits and size of undeclared economy 2009

In sum, contrary to the liberal perspective, it is countries in which there is greater expenditure on social protection and higher expenditure on labour market interventions to help vulnerable groups into the labour market that have smaller undeclared economies.

Larger undeclared economies, therefore, appear to be a product of too little rather than too much intervention.

the role of regulation on temporary employment and temporary work agencies (TWAs)

It does not necessarily follow, however, that all regulation of the labour market necessarily leads to reductions in the size of the undeclared economy. Rather, regulation needs to be appropriate and efficient in order to bring about reductions in the size of the undeclared economy. To clarify this, we here focus on regulation with regard to temporary employment and temporary work agencies (TWAs). To start to analyze this, OECD indicators of the strictness of employment protection legislation (EPL) can be analyzed with regard to firstly, employment protection in relation to temporary employment agencies in particular (EPTWA). These indicators measure how easily firms can resort to temporary employment and temporary work agencies to meet their needs for flexibility and lessen the constraints imposed by regulations on regular open-ended contracts. **The finding, as will be shown, is that in countries where firms can easily resort to temporary employment and TWAs, the undeclared economy is smaller**.

The indicator measuring the strictness of employment protection legislation in relation to temporary contracts (EPT) combines two other indicators, viz: firstly, the regulation of temporary work agency employment (EPTWA); and secondly, indicators of the regulation of standard fixed-term contracts (EPFTC), which quantifies regulations governing hiring of workers on fixed-term contracts (including the types of work for which these contracts are allowed and their renewal and cumulative duration). The result is an overall indicator of employment protection legislation in relation to temporary contracts (EPT). As figure 10 reveals, there is a strong correlation between cross-national variations in EPT and the size of undeclared economies (rs=.492**). The more restrictive the regulations concerning temporary contracts are in a country, the larger is the undeclared economy.

In some countries, for example, although fixed-term contracts (FTCs) are permitted, their use must be justified on the basis of an 'objective' or 'material situation' in terms of whether employees perform a task which itself is of fixed duration, such as seasonal work, or in response to a temporary increase of workload (e.g., Estonia, France, Greece, Luxembourg). In contrast, in other countries, no justification is required to hire a worker on fixed-term contracts, at least for the first contract. In many countries, moreover, there are restrictions on the number of renewals or successive FTCs under which a worker can be employed by the same firm without interruption. In other countries, there are no legal restrictions on the number of successive contracts or renewals (e.g., Australia, Denmark, Finland, Japan, New Zealand). In Belgium, Ireland, Italy and the Netherlands, there is no limitation for the first contract, but cumulative time limits step in when a renewal occur, or a new contract between the same employer and employee is signed. It is therefore perhaps unsurprising that undeclared work is higher in countries in which there are more restrictions.

Figure 10 relationship between the strictness of regulation of temporary contracts and the size of the undeclared

More particularly, when we focus on the strictness of regulation of temporary work agency employment (EPTWA) we see the same relationship with the size of the undeclared economy. The stricter the regulations, the larger the undeclared economy. TWA employment is based on a specific type of contractual relationship. Workers are hired by an agency and temporarily assigned for work into a user firm, typically to perform temporary tasks outside the 'core' business of the user firm or to enable it to cope with short-term increases in workload. In addition, in some cases, TWA workers are employed by the agency under an open-ended contract and often, within this contractual relationship, are paid between fixed-term assignments, although sometimes at a low level (e.g., in Austria, Italy, Slovenia and Sweden). In fact, open-ended contracts between the agency and the worker are the dominant contractual form of TWA employment in at least eight European countries (OECD 2013).
Figure 11 examines whether there is a correlation between the ease with which firms can turn to temporary work agencies and the size of the undeclared economy. The OECD regulation of temporary work agency employment (EPTWA) quantifies the regulation for temporary work agency employment with respect to the types of jobs for which these contracts are allowed and the renewal and cumulative duration of assignments at the user firm. This measure also includes some of the regulations governing the establishment and operation of temporary work agencies. And it comprises requirements for agency workers to receive the same pay and/or working conditions as equivalent workers in the user firm. This last requirement can increase the cost of using temporary agency workers relative to hiring workers on other types of contracts (OECD 2013). The finding is that there is a significant correlation (rs=.485*) between the ease with which firms can turn to TWAs and the size of the undeclared economy; countries where it is easier to resort to TWAs have smaller undeclared economies.

Figure 11a relationship between the strictness of regulation of temporary work agency employment and the size of the undeclared economy

Figure 11b PrES Regulatory Index score for the separate countries

Source: Boston Consulting Group and Ciett, 2013

To further reinforce how there is a correlation between the ease with which firms can turn to TWAs and the size of the undeclared economy, the 'Private Employment Services Regulatory Efficiency Index', developed by the Boston Consulting Group and Ciett, can be analyzed (Boston Consulting Group and Ciett, 2013).

This Index calculates the cross-national variations in the degree of flexibility of TWAs

right to contribute to labour market policies right to negotiate and social protection right to provide services and to contract to operate and the security for workers, using dimensions grouped into four categories:

- A. **the right of establishment**, which evaluates three dimensions, namely the legal recognition of TWAs, the limitations on services and any unjustified restrictions.
- B. **the right to provide services and contract**, which evaluates two dimensions, namely the ability to offer the full range of employment contracts and the removal of restrictions on private employment services.
- C. **the right to negotiate and social protection**, which evaluates two dimensions addressing agency work as a sector on its own and covering the sector's ability to implement social protection for agency workers.
- D. the right to contribute to labour market policies, which evaluates three dimensions addressing: access to training; public/private partnership between employment services, and the commitment to fight illegal practices.

Figure 12 reveals that there is a statistically significant relationship between how nations score on the Private Employment Services Regulatory Efficiency Index and the size of their undeclared economies (rs= 0.558**). Countries where private employment services are regulated in the most efficient manner have smaller undeclared economies. Reasons for this can be that these regulatory conditions foster a private employment services industry that is developed and can contribute to better functioning labour markets where the need to turn to undeclared work is less necessary because firms can easily resort to TWAs to fulfil their needs.

Figure 12 relationship between the private employment services regulatory efficiency index and the size of undeclared economies, 2011

Indeed, breaking down the Private Employment Services Regulatory Efficiency Index into its four component categories displays that this relationship applies across all categories of the Index. Whether one analyzes the right to establishment of TWAs (see figure 13), the right of TWAs to provide services and contract (see figure 14), the right of TWAs to negotiate and provide social protection (see figure 15) or the right of TWAs to contribute to labour market policies (see figure 16), the finding is that countries where private employment services are regulated in the most efficient manner and where it is easier for firms to turn to TWAs, have smaller undeclared economies. However, it is only the right of TWAs to contribute to labour market policies, which is significantly correlated with smaller undeclared economies (rs= -.416*). This component in its turn is built up of three dimensions addressing access to training, public/private partnership between employment services and the commitment to fight illegal practices.

conclusions and recommendations

Recognizing that the undeclared economy lowers the quality of work available, puts at risk the financial sustainability of social protection systems and undermines the business environment through unfair competition, this paper has evaluated the potential contribution of TWAs to reducing the undeclared economy. To do this, this paper has critically evaluated two contrasting explanations for the cross-national variations in the size of undeclared economies, namely the liberal, open market thesis which portrays undeclared employment as more prevalent in economies with high taxes, corruption and too much state interference, and the more structuralist perspective which argues that the undeclared economy is a by-product of the under-regulation of employment, a lack of labour market intervention and reductions in state welfare provision, and that one should therefore pursue state interventions in the labour market and welfare provision in order to tackle the undeclared economy.

Evaluating the implications for undeclared economies of pursuing the recent liberal oriented austerity measures of reducing taxes, pursuing de-regulation and minimising state intervention, this report reveals no correlation between higher tax rates and larger undeclared economies. Instead, it reveals that nations:

- in which larger intervention in the form of labour market policies to protect vulnerable groups occurs;
- in which higher levels of social protection occur; and
- in which it is easier for firms to resort to temporary employment and temporary work agencies to meet labour demands;
- have smaller undeclared economies.

These economies reduce the supply of undeclared labour by providing workers with alternatives for undeclared work such as social protection and labour market policy interventions to help them enter the formal labour market. On the other hand, by making it easier for businesses to turn to temporary employment and TWAs to meet their flexible labour demands, the demand for undeclared labour also diminishes.

This paper therefore encourages:

- a greater recognition of the need to take an active approach to labour markets by:
- stepping up labour market policy interventions as for instance training, employment incentives, start up incentives, job rotation and job sharing;
- creating a mature system of social protection and labour market policy supports like out-of-work income maintenance and support;
- putting in place the measures necessary to reduce the demand for and supply of undeclared labour, like;

- the creation of accessible, well regulated market for temporary employment and temporary work agencies, including the four components of the Private Employment Services Regulatory Efficiency Index, viz:
 - a. the right of establishment, which comprises the legal recognition of TWAs, the limitations on services and any unjustified restrictions.
 - b. the right to provide services and contract, with two dimensions, namely the ability to offer the full range of employment contracts and the removal of restrictions on private employment services.
 - c. the right to negotiate and social protection, with dimensions addressing agency work as a sector on its own and covering the sector's ability to implement social protection for agency workers.
 - d. the right to contribute to labour market policies, which contains three dimensions addressing: access to training; public/private partnership between employment services, and the commitment to fight illegal practices.
- providing an environment in which it is easier for firms to resort to temporary employment and temporary work agencies to meet labour demand reduces UDW.

Moreover, as we are experiencing the growth of an international labour market in which demand and supply of labour are less and less hampered by borders, attention of international bodies for an efficient allocation of labour is of great importance. The initiative of the EU to create an international platform of relevant government bodies to tackle undeclared work is a good example in this respect. This platform could also advise on the above mentioned issues, in particular on the creation of an international environment in which also temporary work agencies can play their role in reducing undeclared work.

Source: Eurostat: lfsq_eppga(Q2); lfsa_eppgai, OECD, Incidence of involuntary part time workers
appendices

appendix A glossary

active labor force	'active' part of the 'potential labor force', i.e. the number of employed plus the number of unemployed
active po pulation	same as 'labor force' or 'active labor force'
agency work	employment where a worker is employed by a temporary work agency and hired out to perform his/her work at (and under the supervision of) the user company, the employment contract is of limited or unspecified duration with no guarantee of continuation, short for 'temporary agency work'
CIETT	International Confederation of Private Employment Agencies
ELFS	European Labor Force Survey
employment rate	total employment, that consists of employees and self-employed, as a percentage of the 'potential labor force'
EU	European Union
fixed-term contract	employment contract of which the end is determined by objective conditions, such as a specific date, the completion of an assignment, or the return of an employee who is temporarily replaced, opposite to 'open-ended contract', same as 'temporary work'
flexible labor	All forms of labor that enables the external numerical adjustment of the labor intake by employers; this can be achieved by employing workers on fixed-term contracts, hiring workers through temporary employment agencies or by hiring labor services from self-employed workers
FTE	fulltime equivalent (1 FTE is usually 36-40 hours per week, depending on country and sector)
GDP	Gross Domestic Product, or national income
gender pay gap	difference in wages between men and women
grey rate	population aged 65+ as percentage of population aged 15-64
IDEAL	International Database on Employment and Adaptable Labor
ILO	International Labor Organization: tripartite United Nations agency with a membership of 183 countries that draws up international labor standards.

inactive	not working and also not actively searching for a job, e.g. housewifes and students who are actively looking for a job are not considered 'inactive', they are counted as 'unemployed', same as 'not in labor force'
inactive population	the people in working age that do not belong to the active population
ISIC	International Standard Industry Classification
labor force	synonym often used instead of 'active labor force': the number of employed plus the number of unemployed (normally defined within a 'working age' category)
labor productivity	the amount of goods and services that an employee can produce; technical definition: total GDP / total employment
LFS	Labor Force Survey
not in labor force	not working and also not actively searching for a job, e.g. housewifes and students who are actively looking for a job are not considered 'inactive', they are counted as 'unemployed', same as 'inactive population'
OECD	Organization for Economic Co-operation and Development (in Dutch: OESO)
open-ended contract	employment contract of unspecified duration, the term of the contract is not fixed, opposite to fixed-term contract, often denoted by 'permanent contract'
own-account workers	workers who, working on their own account or with one or more partners, hold the type of job defined as a self-employed job
participation rate	synonym for employment rate
part-time work (theoretically)	working less than 1 FTE
part-time rate (OECD harmonized def.)	share of employees working less than 30 hours/week
part-time rate (Eurostat def.)	for most countries: share of people who self-report working part-time, for the Netherlands, Sweden and Norway the share of employees working less than 35 hours per week
penetration rate	average daily number of temporary agency workers in FTE, as a percentage of total employment in persons

permanent contract	often used as synonym for 'open-ended contract', although strictly not the same
potential labor force	all persons between 15-64 years of age (or sometimes other age brackets, like 20-64 or 20-75), either employed, self-employed or inactive, same as 'working age population'
self-employed	self-employed persons work in their own business, farm or profes- sional practice, procucing products or services for the market, including labor services
self-employment	part of total employment that consists of self-employed persons
skill level (of a job)	the level of education required for the job: e.g. high school, university etc.
skill level (of an employee)	the level of the highest successfully completed educational degree: e.g. high school, university etc.
temporary agency work	employment where a worker is employed by a temporary work agency and hired out to perform his/her work at (and under the supervision of) the user company, the employment contract is of limited or unspecified duration with no guarantee of continuation, not similar to temporary work
temporary work	used by Eurostat and other official statistics to indicate fixed-term contracts: employment contract of which the end is determined by objective conditions, such as a specific date, the completion of an assignment, or the return of an employee who is temporarily replaced, includes temporary agency work, opposite to 'open-ended contract'
temp workers	employees categorized by the definition of 'temporary work'
total employment	the number of employees plus the number of self-employed
unemployment (international definition)	not working and actively searching for a job, e.g. housewifes and students who are not actively looking for a job are not counted as unemployed, they are considered 'not in labor force' i.e. 'inactive population'
unemployment rate	the number of unemployed as a percentage of the 'active labor force'
workforce	synonym for 'labor force'
working age population	population between 15-64 years of age (or sometimes 20-64), same as 'potential labor force'

appendix B data sources

In most developed countries the use of non-standard, more flexible forms of labor has increased during the last one or two decades. But at the same time very large differences exist between countries in the scale and forms of modern labor relations. The enlargement of the EU with the Eastern and Central-European countries increased heterogeneity even more. Differences in regulations and restrictions, the workforce and the economic situation are considered to be the main causes for these differences. The Netherlands are a special case when looking at flexible labor. Not only are modern forms of labor commonly used in the Netherlands (part-time work can not be called 'non-standard' anymore), also the role of temporary agency work is much larger than in most other countries. For Randstad Holding, a major player in the Dutch, European and even world market for temporary work, it is important to learn more about the use of flexible forms of labor, the driving forces behind it and differences between countries in labor market institutions and the relationship with flexible labor.

Although much statistical information exists – by amongst others OECD, Eurostat, CIETT, ILO and national Statistical Offices – detailed internationally comparable statistics (both time series and cross section data) on flexwork are scarce. A problem with these national statistics is that definitions might differ considerably between countries and that they are adjusted frequently. Another problem is that the distinguished countries, the frequency and the topics covered vary between sources. For Randstad Holding these were reasons to start a project in September 2000 with the aim of collecting labor market data in general and data on flexible forms of labor in particular.

The project resulted in the International Database of Employment and Adaptable Labor (IDEAL). This database is created by SEO Economic Research in co-operation with and commissioned by Randstad Holding. The aim of IDEAL was to bring together a large number of *comparable* international statistics on employment, modern labor relations and agency work. In May 2004 this resulted in the first publication of the Randstad Jobs Report, in which an international outlook was presented mainly based on data as recent as the year 2002. In 2007 an update followed, with a special focus on labor migration, and in 2010 the third report with all 27 EU countries present. Starting from this year, new editions will be published every year under the name Flexibility@Work.

Data comparability issues

The main focus of Flexibility@Work is on international comparability between statistics. For that reason the countries in the database are separated into three categories, representing three different levels of comparability. The primary source is Labor Force Survey (LFS) data from Eurostat: they are to a large degree based on comparable definitions, and also published

frequently and on relatively short term. Figures of these countries can be compared with averages for the EU-27 as a whole. Eurostat focuses mainly on the European countries, so for other countries similar data is taken from the OECD. Although in the use of definitions this source is more or less comparable with Eurostat, the publication horizon is much longer. Most statistics are annual and published in the second half of the following year, so they are often less up-to-date. If neither Eurostat nor OECD can provide information, tertiary sources are considered, but at an enormous cost of comparability loss. Tertiary sources (like ILO) are collected from very different sources, mostly infrequent and therefore not very recent. Differences in national definitions make these statistics only suitable for within-country purposes, not for between-country comparisons. These tertiary sources are therefore only used if they contain valuable information that is comparable with the other sources.

Statistics are presented in nearly all tables and figures for the following countries:

- Austria (AT)
- Belgium (BE) .
- Bulgaria (BG)
- Croatia (HR) •
- Cyprus (CY)
- Czech Republic (CZ) •
- Denmark (DK)
- Estonia (EE) •
- Germany (DE)
- Finland (FI) •
- France (FR)
- Greece (EL) •
- Hungary (HU) •
- Ireland (IE) •

- Italy (IT)
- Latvia (LV)
- Lithuania (LT)
- Luxembourg (LU) •
- Malta (MT)
- Netherlands (NL)
- Poland (PL)
- Portugal (PT)
- Romania (RO)
- Slovenia (SI)
- Slovakia (SV)
- Spain (ES)
- Sweden (SE)
- United Kingdom (UK)

Where available statistics are also presented for the following countries:

- Argentina (AR)
- Australia (AU) •
- Brazil (BR)
- Canada (CA) •
- India (IN)
- Japan (JP)
- Mexico (MX) •

- New Zealand (NZ)
- Norway (NO)
- Russia (RU)
- South Africa (ZA)
- Switzerland (CH)
- Turkey (TR) •
- United States (US)
